16. Abstracts

The catalog is a computer listing of federal agency monitoring activities derived from the "Inventory of Federal Pesticide Monitoring Activities in Effect July 1973." Instructions for completing the Inventory and the Inventory form are found in Appendix A. Residue data obtained from the monitoring activities listed in this catalog frequently appear in the Pesticides Monitoring Journal and other similar publications. The monitoring Panel has defined monitoring as the repeated sampling and analysis of components of the environment to produce reliable estimates of the pesticide levels in the components and the change of these levels in time. Additional criteria for reporting a monitoring activity in this catalog are that examinations for residues be made by or on behalf of a federal agency, and that monitoring has been in effect since July 1, 1973.

## FOREWORD

The Federal Working Group on Pest Management (FWGPM) coordinates federal activities concerning pests, pesticides, and pest management. In 1964 the Federal Committee on Pest Control, a predecessor to the FWGPM undertook to implement Recommendation VI A2 of the 1963 President's Science Advisory Committee Report, *Use of Pesticides* "...to develop a continuing network to monitor residue levels in air, water, soil, man, wildlife, and fish..." To implement this recommendation the FWGPM through its Monitoring Panel, formerly the Subcommittee on Monitoring, sponsors the National Pesticide Monitorin Program. In addition, the Panel reviews all other federal monitoring programs and plans, and encourages the development and use of uniform sampling and analytical methodologies.

In December 1968 the Subcommittee on Monitoring published the *Catalog of Federal Pesticide Monitoring Activities in Effect July 1967.* Five years later, having completed the "Inventory of Federal Pesticid Monitoring Activities in Effect July 1973," the FWGPM determined that a revision of the *Catalog* was in order. Here, then, several years and additional responsibilities later, is the new pesticide monitorir catalog: tribute, once again, to the cooperative effort of agencies represented on the FWGPM.

## ACKNOWLEDGMENTS

From its initiation in 1972 to the present, the *Catalog* represents the labors of the Monitoring Panel, FWGPM.

Current Panel members and the following former members are recognized for their contributions.

| | |
|---|---|
| H. C. Barry | FDA, DHEW |
| H. R. Cook | APHIS, USDA |
| D. R. Embody | APHIS, USDA |
| L. C. Gibbs | ES, USDA |
| D. P. Graham | FS, USDA |
| W. L. Johnson | FWS, USDI |
| J. O. Lee, Jr. | APHIS, USDA |
| W. E. Martin | FWS, USDI |
| P. R. Nickerson | FWS, USDI |
| J. T. Whitlaw | DA, DOD |
| A. R. Yobs | OPP, EPA |

The following persons served on the task group for development of the "Inventory of Federal Pesticide Monitoring Activities in Effect July 1973" and the initial format of the revised catalog:

| | |
|---|---|
| P. F. Sand, Chairman | APHIS, USDA |
| G. A. Billingsley | GS, USDI |
| E. L. Cox | ARS, USDA |
| M. D. Edwards | GS, USDI |
| H. R. Feltz | GS, USDI |
| R. G. Heath | FWS, USDI |
| A. Inglis | FWGPM |
| W. R. Mattersdorff | FDA, DHEW |
| J. R. Wessel | FDA, DHEW |
| G. B. Wiersma | OPP, EPA |

The cooperation of the many federal agencies supplying information requested in the Inventory made this current edition possible. Special thanks are due to the Food and Drug Administration, U.S. DHEW, for key-punching services, and to the Geological Survey, USDI, for programming and computer printout services. The *Catalog* was edited and published by the Secretariat, FWGPM, with the assistance of the editorial staff of the *Pesticides Monitoring Journal:* Martha Finan and Joanne Sanders.

Preceding page blank

# INTRODUCTION

The *Catalog* is a computer listing of federal agency monitoring activities derived from the "Inventory of Federal Pesticide Monitoring Activities in Effect July 1973." Instructions for completing the Inventory and the Inventory form are found in Appendix A. Residue data obtained from the monitoring activities listed in this catalog frequently appear in the *Pesticides Monitoring Journal* and other similar publications.

The Monitoring Panel has defined monitoring as *the repeated sampling and analysis of components of the environment to produce reliable estimates of the pesticide levels in the components and the change of these levels in time.* Additional criteria for reporting a monitoring activity in this catalog are that examinations for residues be made by or on behalf of a federal agency, and that monitoring has been in effect since July 1, 1973.

Tables 1-5 reflect the increase in monitoring activities since the original 1967 compilation. Much of this increase is due to the implementation of many federal pesticide monitoring programs which were only partly operational in 1967.

Questions of a general nature regarding this catalog should be directed to the Executive Secretary, Federal Working Group on Pest Management, East Tower, Fourth and M Streets, S.W., Washington, D.C. 20460. Paper or microfiche copies, will be available from the National Technical Information Service, 5285 Port Royal Road, Springfield, Va. 22151, as Publication NO. FWGPM-75-1.

## SYNOPSES OF MONITORING PROGRAMS

The National Pesticide Monitoring Program (NPMP) was initially designed around the minimum monitoring needed to establish baseline levels of pesticides in environmental components of air, soil, water, estuaries, fish, wildlife, food and feed, and humans and to assess changes in these levels. The Program was first described in Volume 1, Number 1 of the *Pesticides Monitoring Journal*. Monitoring activities may change to incorporate research findings, utilize improved methodology, reflect changes in program emphasis, and accommodate findings within existing programs. In 1971 a review of the NPMP components was completed by the Monitoring Panel. Changes in federal pesticide activities resulting from Agency realignments were described in the *Pesticides Monitoring Journal*, Volume 5, Number 1.

Since its establishment in 1970, the U.S. Environmental Protection Agency has been the focal point of federal policies and activities for pesticides. However, many pesticide monitoring activities have remained in other agencies, and the need remains for a coordinated approach to pesticide monitoring.

The following synopses briefly describe major NPMP components itemized in this catalog. Several other federal monitoring activities, not a part of the NPMP and not synopsized here are also listed in the *Catalog*.

Preceding page blank

## National Soils Monitoring Program

The National Soils Monitoring Program was one of the earliest operational components of NPMP. The present program, designed and initiated by the U.S. Department of Agriculture, was transferred to the Environmental Protection Agency in December 1970 and is now in the Office of Pesticide Programs, Technical Services Division.

The Program was designed to determine average levels of pesticide residues in soils and agricultural crops in the United States and, through periodic sampling, to determine changes in these levels. Two land-use categories are recognized: cropland and noncropland. Cropland is sampled at the rate of one 24.7-hectare (10-acre) block for every 98,800 hectares (40,000 acres); noncropland is sampled at the rate of one 24.7-hectare (10-acre) block for every 988,000 hectares (400,000 acres). One-quarter of the allocated sites in each state are sampled every year. A pilot program in six states was operated in 1967, and 43 and 37 states were sampled in 1968 and 1969, respectively. In 1971 through 1973, 35 states were sampled each year; the number was limited by available resources.

At the time of harvest, 50 soil cores, each 5.1 cm (2 in.) in diameter by 7.6 cm (3 in.) deep, are taken in a 5 x 10 grid pattern. The cores are then composited, sieved, and thoroughly mixed, and a 2-liter subsample is taken. A sample of the standing crop is taken if available. Data on the crop and the kinds and amounts of pesticides applied to the site that season are also collected. Soil and crop samples are labeled, packed for shipping, and sent to the EPA Pesticide Monitoring Laboratory, Bay St. Louis, Miss., for analyses.

All soil samples are analyzed for arsenic, organochlorine insecticides organophosphates, and triazines. Samples are also analyzed for phenoxy herbicides when use records indicate application. Crop samples are routinely analyzed for organochlorine and organophosphate insecticides, and for triazines and phenoxy herbicides if they were applied.

## National Water Monitoring Program

The National Water Monitoring Program was originally conducted by the U.S. DHEW Public Health Service. Since 1973 the program has been jointly sponsored by the USDI Geological Survey, which collects the samples, and the Environmental Protection Agency, which analyzes them. The 153-station network is designed to randomly sample surface water and sediment in order to continually assess pesticide residue levels. Water samples are collected quarterly and bottom-sediment samples, semi-annually.

Geological Survey personnel normally composite several depth-integrated water samples from the cross section of a stream. Using an impact sampler designed to retain fine materials, sediment samples are collected at points across the streambed, placed in a single container, and subsampled in the laboratory. All samples are analyzed at the EPA Pesticide Monitoring Laboratory. Sediment and water samples are analyzed for organochlorine and organophosphate insecticides.; water is also analyzed for phenoxy herbicides.

## Estuarine Monitoring Program

The Estuarine Monitoring Program began in 1965 under the auspices of the USDI Bureau of Commercial Fisheries (BCF) and in cooperation with state marine agencies. From 1965 until 1972 the Program concentrated on colleting and analyzing ten species of mollusks from 180 estuarine sites in 15 states. The pesticide monitoring aspects of the BCF Program were transferred to EPA in 1970. Beginning in 1972 the estuarine monitoring program was redesigned in an attempt to monitor pesticide residues in estuarine finfishes from all 200 primary estuaries of the Nation except those in Louisiana and Maine.

Sampling began in the summer of 1972 and, with some minor exceptions, has been repeated at 6-month intervals. Plans call for a 2-year period of sampling to establish a baseline, a period without sampling, and a repetition of the previous sampling to determine trends. Fish species are selected to represent two different food chains, e.g., carnivores and omnivores, to permit possible identification of modes of entry of pollutants into the food web. Fish less than 1-year old are sampled in an effort to determine when waters become polluted. Replicate samples of 25 fish each are analyzed to insure sample homogeneity.

Fish samples are either frozen immediately in specially constructed aluminum bags until they can be prepared for shipment or dry-processed with sodium sulphate according to specific directives. Dry-processed samples can be stored up to 30 days at room temperature before analysis at the EPA Pesticide Monitoring Laboratory. Analyses include organochlorine and organophosphate insecticides, lead, cadmium, chromium, zinc, and mirex.

## Ocean Monitoring Program

The Ocean Monitoring Program, a cooperative pilot program of EPA and the National Oceanic and Atmospheric Administration, determines ambient levels of pesticide residues in marine fishes. The Program utilizes scheduled resource survey cruises of the National Marine Fisheries Service (NMFS) and operates on minimal funding for sample preparation and analysis.

NMFS personnel collect commercially caught fish from the Northwest Atlantic, the New York Bight, and two areas in the Gulf of Mexico. Twenty to forty fish from each site are placed in aluminum bags and frozen for storage at NMFS Centers until processed by EPA technicians. Replicate samples of 20 livers are removed from the frozen samples, dry-processed with sodium sulphate, and shipped to the EPA Pesticide Monitoring Laboratory for analyses. Samples are analyzed for organochlorine and organophosphate insecticides, heavy metals and mirex.

All data are coded and processed for the EPA computer information bank. Plans call for extending the program to other major oceanic fishing areas off the California and Alaska coasts. Sampling will be repeated about once every 5 years.

## National Fish Monitoring Program

Since spring 1967, the Fish and Wildlife Service (FWS) has monitored fish for organochlorine insecticide residues. The original design using 50 sampling stations in the continental United States was expanded to 100 stations in 1970. Criteria for selecting stations were: availability of desired species of fish; relationship of sampling sites to other NPMP components, particularly those stations proposed for monitoring surface waters; existence of a state-sponsored monitoring program or cooperative participation by a state conservation agency; and availability of suitable manpower and facilities to make field collections.

Data on pesticide residues obtained during the first 3 years suggested that annual sampling would probably be sufficient to identify trends of pesticide contamination in fish. Thus, early fall sampling was initiated in 1970. Fish are collected and handled to prevent contamination of the sample with extraneous chemicals. Three composite samples of fish are collected at each station. Each composite sample consists of three to five adult fish of a single species and uniform size. Species are selected to represent the three types of feeding habits: herbivorous, carnivorous, and omnivorous. If possible, the same three species selected for a given station are collected each year. To measure field variations, one composite sample from each

station was replicated in the 1970 collections. Since 1971 all composite samples have been replicated. Thus a total of 600 samples are presently collected for analysis.

Samples are homogenized and analyzed on a whole-fish basis for percent lipid content, 11 organochlorine insecticides, PCB's, and several heavy metals. Other organic contaminants may be identified and measured when there is sufficient justification and funding.

## National Wildlife Monitoring Program

The Fish and Wildlife Service also ascertains, on a nationwide basis and independent of specific use patterns, the levels and trends of certain pesticidal chemicals and other pollutants in the bodies of selected forms of wildlife. Early in the development of the wildlife monitoring program, certain criteria were recognized as important in selecting species of wild animals suitable for pesticide monitoring. Ideally, species selected should be geographically well distributed, reasonably abundant, and readily available for sampling. Animals near the top of food chains should also have the capacity to reflect residues in organisms occurring at lower levels in the same food chains. Based on these criteria, species chosen for monitoring include starlings (*Sturnus vulgaris*), mallards (*Anas platyrhynchos*), and black ducks (*Anas rubripes*).

## STARLING MONITORING

The starling, a terrestrial species found throughout the year in most of the contiguous 48 states, is generally regarded as expendable and its omnivorous food habits are expected to reflect the general environmental presence of persistent pesticides and certain heavy metals.

Since 1967 when starlings were first monitored, these birds have been collected according to a special design by dividing a map of the 48 contiguous states into blocks of $5^{o}$ latitude and longitude. Thus, 40 sampling blocks are delineated. Within each block up to four sampling sites are randomly selected. Blocks on the periphery of the study area, i.e., coastal and border states may contain fewer, than four sites, whereas blocks completely within the study area usually contain four sites.

A composite sample of 10 birds is collected at each site. Birds are trapped or shot; no toxicants are used. The 10-bird composite is wrapped in aluminum foil and frozen immediately after collection until analysis. Birds are prepared by removing the beaks, feet, and wings at the first joint out from the body. Birds are then skinned and the removed parts are discarded. The remaining 10 carcasses are ground together and an aliquot is taken for analysis.

Analyses for persistent organochlorine insecticides and PCB's have been performed on starling samples from approximately 139 sites, collected in even-numbered years since 1970. During odd-numbered years beginning in 1971, samples from 53 sites have been analyzed for residues of lead, cadmium, arsenic, mercury, and selenium. Birds analyzed for lead are collected by means other than lead shot: live traps or mist nets, for example.

## DUCK-WING MONITORING

In a research study to determine the relationship of pesticide residues in wings to residues in other parts of the body, highly significant correlations were found between DDT residues in wings and those in breast skin, breast muscle, kidney, uropygial gland, adrenal gland, pancreas, brain, gonads, liver, and thyroid. In a pilot study in 1964, duck-wing monitoring was evaluated using mallard and black ducks from New York and Pennsylvania. On the strength of the findings of these studies, duck wings were chosen for monitoring.

Duck wings from all parts of the Nation are available for monitoring purposes as a byproduct of a nationwide survey of waterfowl productivity in which cooperating hunters mail thousands of wings to central collection points for biological examination. As mentioned above, the mallard and black duck are used most frequently because the combined range of these two species covers the continental United States. The mallard is relatively abundant except in the Eastern States where the black duck predominates.

In the sampling process, wings are first segregated by species into groups by state. Each group is sorted into pools of 25 wings each, and a random sample of these pools, roughly proportional in number to a state's harvest, is selected for pesticide analysis. Since these pools represent the whole state, the site identification shown in the main listing, is the State. Wings are kept frozen; prior to analysis, they are trimmed of flight feathers, chopped and blended into an homogenate. Samples are analyzed for organochlorine insecticides, PCB's and occasionally heavy metals by methods involving preliminary separation by thin-layer chromatography and final analysis by gas-liquid chromatography.

The first full scale monitoring effort was conducted in the winter of 1965-1966 (1965 hunting season). Separate pools of wings from adult and immature birds totalling approximately 500 samples were analyzed from the 1965 and 1966 hunting seasons. In the 1969 hunting seasons sampling was confined to adult birds and a total of 214 pools was analysed. Sampling is repeated on a three year cycle.

## National Food and Feed Monitoring Program

The national program for monitoring pesticide residues in food and feed is operated by the USDHEW Food and Drug Administration (FDA), and the USDA Animal and Plant Health Inspection Service (APHIS). This program determines levels of pesticide residues in unprocessed and commercially processed consumer food commodities, animal feeds, and composites of food items prepared for human consumption. Programs seeking to accomplish this objective include the FDA Market Basket Study to determine pesticide residues in the basic 2-week diet of a 16-to-19-year-old male, statistically the nation's largest eater; the FDA nationwide surveillance of unprocessed food and feed; and the APHIS monitoring program of meat and poultry samples taken from animals at slaughter.

This Program also determines levels of contaminants not necessarily attributable to pesticide application, e.g., mercury, PCB's, cadmium, arsenic, lead, selenium, and zinc. The important impact of pesticide residues in human and animal food lies in their consumption. Therefore, the examination of foods as they are prepared and ready for consumption is of special interest to this monitoring program.

Because no uniformity may be expected within even a single food item due to extreme variations in local growing, harvesting, and processing procedures, sampling patterns must take into account geographical and seasonal variables. Rather than examine the 120 individual food items in the Market Basket Survey, a practical compromise was reached. Foods were composited by the following classes: meats, dairy products, leafy vegetables, grains, potatoes, root vegetables, legume vegetables, garden fruits, fats, sugars, and beverages. Data resulting from analysis of these composites may be used to calculate the approximate residue intake associated with any diet pattern but are more useful in determining trends in the national and geographic incidence and levels of pesticide residues. Detailed information on commodity groups and the pesticide compounds monitored in this program was published in the *Pesticides Monitoring Journal*, Volume 5, Number 1.

### THE MARKET BASKET PROGRAM

The Market Basket Program on Total Diet Studies was updated in 1971 and 1972. Composition of the baskets was slightly changed to reflect the latest USDA information on food consumption. A total of 117 items are now included in each basket, and regional variations are recognized by the different participating Districts. There has been no change in sampling frequency. The Market Basket Survey is now conducted nationwide in the four geographic regions determined by USDA to represent the Northeastern, Southeastern, Central, and Western United States. Sampling sites are chosen from different cities representing Standard Metropolitan Statistical Areas as well as smaller population centers (less than 50,000). Thirty Market Basket samples are collected annually, with approximately equal emphasis on each of the four geographic regions.

Market Basket items which normally require further processing by cooking, such as fresh meats and certain raw vegetables, or preparation for eating raw, such as tomatoes, carrots, celery, lettuce, cucumber, cabbage, and fresh fruits, are prepared in a diet kitchen under the direction of a dietician. Some food items - cabbage, for example - are included in both raw and cooked form. Items normally consumed as purchased and items which do not otherwise require further processing are retained by the examining laboratory for compositing by commodity groups with the foods prepared by the diet kitchen. These include dairy products, luncheon meats and frankfurters, canned meats, some fruits and vegetables, potato chips, canned fruit juices, concentrated fruit juices, and frozen fruits.

## THE NATIONAL COMMODITY SURVEILLANCE PROGRAM

Another means by which FDA accomplishes the objectives of the NPMP is the commodity surveillance program for pesticide residues. This has replaced the monitoring program based on food classes and the older surveillance activities based on sampling at destination. The present surveillance program determines pesticide residue levels of individual commodities on a geographical basis by a statistically developed plan of sampling individual items of food or crops at their origin. Each of the 18 FDA field districts samples and examines the major food and feed items produced within its area to determine levels of pesticide residues. Most of the sampling is directed nationally to assure adequate coverage of nationally important commodities. A lesser amount of sampling is directed by the individual FDA districts to cover locally important commodities not included in the national surveillance plan.

## THE MEAT AND POULTRY MONITORING PROGRAM

APHIS has primary responsibility for sampling meats and poultry. This program involves about 1,700 slaughtering plants. Instructions for sampling provide for a random selection of animals and/or birds from the total slaughter in each federally inspected plant.

Various screening procedures are used to detect background levels. Pesticides residues near or above tolerance are confirmed by methods of analysis in the FDA *Pesticide Analytical Manual*. The analyses are made on the edible tissues. In beef and dairy cattle and poultry, heavy metals such as mercury, lead, cadmium, copper, and arsenic are identified by atomic absorption methods on muscle, liver, and kidney tissue. The same methods are used on imported products such as canned pork and frozen boneless beef.

## National Human Monitoring Program

Established in 1967 by the Public Health Service, the National Human Monitoring Program seeks to determine on a national scale the incidences, levels, and other evidences of exposure to pesticides and PCB's in the general population of the United States. The Program was transferred to EPA upon creation of that Agency in 1970.

Conforming to an experimental design, pathologists are recruited to take adipose tissue samples from post-mortem examinations and surgical specimens. Samples are not taken from cases of known or suspected pesticide poisoning, cachectic patients, or patients who have been institutionalized for long periods. Samples are frozen and shipped under dry ice to contract laboratories to be analyzed for PCB's and 17 organochlorine pesticides. All contract laboratories participate in a quality assurance program moderated by the EPA Pesticides and Toxic Substances Effects Laboratory, Research Triangle Park, N.C.

In 1970 the sampling design was altered to achieve statistically more valuable information. The contiguous 48 states were divided into four census regions, and approximately 1,950 samples of adipose tissues were collected annually from 39 randomly selected centers apportioned by population to the four census regions. In 1972 the sampling design was further modified by increasing the number of collecting centers to 75, and the total samples to slightly over 2,000.

As refinement of methodology permits, the human monitoring program will be expanded to analyze adipose samples for additional pesticide chemicals or metabolites and other pollutants. New methodologies have also been developed which permit estimates of human exposure to other groups of pesticides by measuring the metabolism or excretion of parent compounds or metabolities in urine or blood. These methods are being evaluated to determine whether they can be used to survey residues in the general population. Adopting such methods may require modification of both sampling design and operating procedures.

## The Department of the Army Pesticide Monitoring Program

So that pesticides can be used without constituting a threat to human populations or an unwarranted impact on the environment, the Army Pesticide Monitoring Program provides estimates of pesticide and pesticide degradation products in selected components. Soils, sediment, water, birds, and fish from 34 major Army installations in the continental United States are sampled. Where unique circumstances warrant, special sampling from these or other Army installations supplement scheduled components. Environmental components are sampled

according to procedures established for these same components under the NPMP, appropriately modified to accommodate conditions at each installation. In the main listing, the geographic coordinates listed under site identification are for the installation headquarters. All samples are analyzed at the U.S. Army Environmental Hygiene Agency, Aberdeen Proving Ground, Md.

## Mirex Monitoring Program

In 1972 APHIS implemented a biometrically designed mirex monitoring program to evaluate residues in the environment resulting from aerial application of mirex for control of the imported fire ant. The Program is concerned only with mirex residues in the 9 southeastern states in which control efforts are concentrated. The basic sampling unit is a 24.7-hectare (10-acre) site selected at random from within each 49,400 hectares (20,000 acres) of treated land. Environmental components from the monitoring sites include soil, vegetation, water, sediment, fish, crayfish, birds, and small mammals. Samples are analyzed for mirex residues at the APHIS Environmental Monitoring Laboratory in Gulfport, Miss.

Since 1972 monitoring activities have been carried out twice yearly, corresponding to the cooperative Federal/State control program. Label restrictions, however, limit aerial treatment of mirex to one application a year in a given location. Likewise, monitoring sites are selected according to acres actually treated. In no cases are the same sites sampled more than once. Because of this, it was easier to identify monitoring sites by state and county rather than by assigning geographic coordinates. Naturally some counties could be monitored more than once if partly treated with mirex in the spring and completed in the fall of a given year or treated again in subsequent years.

III

## INDEX OF FEDERAL PESTICIDE MONITORING ACTIVITIES

## EXPLANATION OF SPECIFIC ITEMS IN THE INDEX

### State and County

Monitoring activities are listed in alphabetical order of each state and the District of Columbia. The Canal Zone, Puerto Rico, and the Virgin Islands appear last. Within each state, the Federal Information Processing Standards (FIPS) codes representing the counties, county equivalents, and independent cities or census divisions are listed in numerical order of the codes. These codes and state abbreviations are shown in Appendix B.

Monitoring sites which cover more than one political subdivison are coded in this catalog as submitted on the inventory form, or according to the appropriate subdivision as first listed in the index of the *1974 Commercial Atlas and Marketing Guide* (Chicago: Rand McNally and Company).

### Latitude, Longitude

Geographic coordinates are listed as submitted on the inventory form, or as assigned from information in the *National Atlas of the United States, 1970* (Washington: U.S. Government Printing Office).

### Geographic Coordinate - Type

The geographic coordinate code appears in Appendix C. Coordinates for the geographic center of a state (code E) are estimated from information in *Elevations and Distances in the United States* (Washington: U.S. Government Printing Office).

### Year Record Began

This is the calendar year when initial sampling was begun by the Agency for the specified component(s).

### Site Identification

Agency abbreviations and addresses are shown in Appendix D. The complete site identification should be used when communicating about a monitoring site. *Note: a monitoring site may have more than one monitoring activity.*

### Component Classes - Frequency

Refer to Table 3 for a listing of component classes shown in abbreviated form in the column headins. Frequency codes are shown in Appendix C.

Preceding page blank

## Pesticide Classes - Frequency

Refer to Table 4 for complete listing of pesticide classes shown in abbreviated form in the column headings. The frequency code is the same as that used for component classes in Appendix C.

## FWGPM Number

The FWGPM number is a record number assigned to a monitoring activity by the Panel. This number should be used along with the site identification when communicating about a monitoring activity listed in this edition. Inquiries pertaining to a specific monitoring program, site, or activity should be addressed to the appropriate Agency office shown in Appendix D.

Federal Working Group on Pest Management

# INVENTORY OF FEDERAL PESTICIDE MONITORING ACTIVITIES IN EFFECT JULY 1973

## Introduction

The Federal Working Group on Pest Management is the primary staff level coordinating mechanism for federal activities concerning pesticides, pests and pest management. Through its Monitoring Panel implementation continues of Recommendation VI A2 of the President's Science Advisory Committee Report "Use of Pesticides:" "Cooperate with other departments to develop a continuing network to monitor residue levels in air, water, soil, man, wildlife, and fish..." The Working Group through the Monitoring Panel sponsors the National Pesticide Monitoring Program. In addition, it maintains cognizance of all monitoring programs and plans of federal agencies, and encourages the development and use of uniform sampling and analytical methodology. Consistent with these responsibilities, the Working Group is conducting this Inventory.

The attached form: "Inventory of Federal Pesticide Monitoring Activities in Effect July 1973" requests information from each federal agency on all of its pesticide residue monitoring activities. The Inventory will be compiled into a Catalog of Federal Pesticide Monitoring Activities in Effect July 1973, which will provide an index and description of federal pesticide monitoring activities for the purpose of identification and coordination of monitoring at the federal level, and at the state and local levels. It will update the Catalog prepared in 1967.

To this end it is requested that you submit the data required on each monitoring site in accordance with the definitions and explanations which follow, and forward the completed forms to the Executive Secretary, Federal Working Group on Pest Management, Room 501, East Tower, Fourth and M Streets, S.W., Washington, D.C. 20460. In the event there are questions, or you wish additional copies of the form or the instructions, please call the Secretariat of the Working Group on (202) 755-8294.

We would appreciate receiving the completed forms by January 1, 1974.

## Definitions

The Monitoring Panel of the Federal Working Group on Pest Management has defined "monitoring" as "...the repeated sampling and analysis

of components of the environment to produce reliable estimates of the pesticide residue levels in the components and the change of these levels with time."

The following additional criteria should be applied when completing the Inventory form:

(a) Examinations for residues are made by or on behalf of a federal agency;

(b) Monitoring was in effect July 1, 1973.

General Explanations

Complete an Inventory form (also referred to as "form") for one or more classes of components (Item 4A) at a given monitoring site (Item 2) that ordinarily have the same "Frequency of Sampling" (Item 4B), and which are ordinarily being examined for the same pesticide classes (Item 4C).

Note: In lieu of completing one form for each inventoried site, agencies may submit all or part of the information requested, such as Items 2 and 3, on computer printouts, existing lists or other types of reproduction, if this facilitates the process. Similarly, if information is common to more than one form, as may be the case for Items 1, 4, 5, 6, 7, 8, 9 and 10, show the common information on one form, and refer to this form by "same as site I.D....." (Item 2A).

If a form does not provide sufficient space for an entry, please use Item 7 - "Remarks" and the back of the form.

Inventory forms are to be prepared by the federal agency:

(a) directly responsible for field operations involving the monitoring at the site reported in Item 2, even though the actual sampling may be delegated, or

(b) sponsoring the monitoring at the site reported in Item 2 and normally receiving the data, although a non-federal agency may perform the field work.

Source of supporting funds is not a criterion for determining the agency responsible for completing the form. For example, if Agency "A" collects soil samples as part of monitoring at a certain site by Agency "B" (although on behalf of Agency "A"), Agency"B" should report the monitoring site as part of this Inventory.

Explanation for Specific Items

Before completing individual items on the form, please refer to "Note" under General Explanations, above.

1. Agency Name: Self explanatory.

2A. Monitoring Site Identification: Enter the name, number, or code of the site as used by the office to which inquiries about this site should be directed (Item 8).

2B. Monitoring Site Location: Enter the physical location of the monitoring site (Item 2A). Code state and county according to the Federal Information Processing Standards Publications 5 - 1 and 6 - 1. These publications are available at the NBS Clearinghouse for Scientific and Technical Information, U.S. Department of Commerce, Springfield, Va. 22151.

If a monitoring area is in more than one state or county, e.g., in a lake, a river, an estuary, etc., show the states or counties where most monitoring takes place. Such added information should be shown under Item 7 - "Remarks."

Show Longitude and Latitude only if these are used in specifying site location.

3. Year Record Began: Enter the calendar year that monitoring at the site shown in Item 2 began. The year should be that of the initial component sampling, even if the specific parameter sampled was changed.

4A. Component Classes Sampled: Show on one form the component classes most frequently included in the samples being examined for pesticide residues which ordinarily have the same "Frequency of Sampling (Item 4B) and the same "Pesticide Classes Examined" (Item 4C).

Please refer to the following examples:

(a) Fresh water fish, raw water - surface, and sediment are sampled at the same monitoring site. Fresh water fish and raw water - surface are sampled monthly, and sediment is sampled annually. Complete one form to show the information relating to fresh water fish and raw water - surface, and another to show the information relating to the sampling of sediment.

(b) Grains and soil are sampled at the same monitoring site. Grains are ordinarily examined for chlorinated hydrocarbons and organophosphates, and soil is ordinarily examined only for chlorinated hydrocarbons. Complete one form to show the information relating to the sampling of grains, and another form to show the information relating to the sampling of soil.

4B. Frequency of Sampling: Indicate the usual periodicity of the "Component Classes Sampled" (Item 4A). Please check only one box for any one form.

4C. Pesticide Classes Examined: Indicate the classes of pesticides which are examined more frequently for residues. If you do not know the Class, list the pesticides examined under Item 7 - "Remarks."

5. References: Show references (authors, titles and facts of publications) to material which describes the protocol or presents findings of the Pesticide Monitoring Activity of which the inventoried site (Item 2) is a part.

6. Are Environmental Components at Monitoring Site (Item 2) Examined for Polychlorinated Biphenyls? Self explanatory.

7. Remarks: Use the back of the form if insufficient space is provided here.

8. Office to Which Inquiries About this Monitoring Site Should be Directed: Enter the name, mailing address and phone number.

9. Office Completing Form: Enter complete information to provide for possible inquiries regarding this form.

10. Compiler's Name: Self explanatory.
